Gamma index of biotite crystals ¹¹					1.66	1.64															
Beta index of amphibole crystals ¹¹					1.67	1.674															
Beta index of ferriferous ²³ clinopyroxene crystals ¹¹					1.697	1.700		1.710	1.705	1.701	1.705	1.705	1.68	1.64	1.70						
Beta index of calciferous ²⁴ clinopyroxene crystals ¹¹					1.705	1.700		1.704	1.705	1.701	1.705	1.68	1.68	1.705	1.707						
2V of ferriferous clinopyroxene crystals ¹⁴					50°	47°															
2V of calciferous clinopyroxene crystals ¹⁴					53°	54½°															
Composition of hypersthene crystals ²⁵							En ₅₅₋₅₈	En ₅₇	En ₅₇₋₈₃	En ₆₀	En ₅₇₋₈₁	En ₅₉	En ₅₉₋₅₅	En ₅₂	57½°						
Average composition of hypersthene crystals																					
Composition of olivine crystals ¹⁵	FO ₈₈₋₇₇	FO ₈₄₋₈₈	FO ₈₈₋₇₈						FO ₈₇₋₇₂	FO ₇₀											
Average composition of olivine crystals	FO ₇₄	FO ₈₈	FO ₇₄																		
Refractive index of groundmass or intersertal glass							1.543	1.505	1.499		1.514		1.498								

¹ Determined by point counter described by Chayes (1949).
² Minimum size of crystals about 0.1 mm; modes of intrusive rocks include somewhat smaller crystals.
³ Visual estimate. Rare hypersthene also present.
⁴ "Ghosts" of olivine, now antigorite, penninite, quartz, and magnetite.
⁵ Includes palagonitized glass, zeolites, etc.
⁶ Includes 0.6 percent of calcite and 2 percent of chlorite, antigorite, quartz, and zeolites.
⁷ Includes 0.1 percent of zeolite-filled vesicles.
⁸ Includes felsic groundmass with microveinlets of quartz, zeolite, and magnetite.

⁹ Plagioclase compositions from refractive index data, using curves by Calkins-Hess (Kennedy, 1947, fig. 1) and by Tsuboi (1925, pl. 1). Most determinations within ±An₈, limit, ±An₈.
¹⁰ Based on optical determination of refractive indices; partial analysis for alkalis (Na+K, 1.14 percent) indicates composition of An₉₁.
¹¹ Refractive indices determined with sodium light at 25° C. ±2° C. Most measurements within 0.003, excepting those on hornblende.
¹² Data on groundmass augite.
¹³ Diopside augite (β=1.696) also present; probably xenocrysts.
¹⁴ 2V measurements on grains in thin section, using 4-axis universal stage; average of several readings, except for No. 9, in which full range of 2V variation of augite is shown.

¹⁵ Olivine composition from refractive index data, using curves by Bowen and Schairer (Kennedy, 1947, fig. 6). Most determinations within ±Fo₁.
¹⁶ Also at least two additional olivines, probably xenocrysts, with overall range of composition from Fo₈₈ to Fo₈₁.
¹⁷ Data on unpalagonitized clear glass.
¹⁸ Bleached biotite; probably a chlorite.
¹⁹ Entirely decomposed to opaque oxide-clinopyroxene aggregate.
²⁰ Largely decomposed to secondary minerals: opaque oxide rims, clinopyroxene, fibrous green mica and amphibole, sodic plagioclase, brown glass with apatite needles, and carpholite(?).

²¹ Determination by refractive indices (α=1.527-8; γ=1.538) indicates nearly pure albite.
²² A few plagioclase crystals are zoned through entire range, An₃₈₋₈₈.
²³ Includes ferriferous augite and ferroaugite following classification of Poldervaart and Hess (1951, p. 474).
²⁴ Includes diopside augite, salite, and ferrosalite following classification of Poldervaart and Hess (1951, p. 474).
²⁵ Orthopyroxene composition from refractive index data, using curves by Hess (Kennedy, 1947, fig. 3).
